Abs Jour : Ref Zhur - Biol., No. 10, 1958, No. 46751

Author : Takacs, L.; Nagy, Z., Kallay, K.

Inst : Academy of Sciences People's Republic of Hungary.

Title : Pulmonary Circulation in Shock. A Preliminary Report.

Orig Pub : Acta Physiol. Acad. sci. hung., 1957, 11, No. 2, 233-234.

Abstract : A shock was produced in dogs by 200-300 blows with a hammer applied to their hind legs. The medial volume per minute fell to 39 percent of the initial magnitude, and the pressure of the carotid artery fell to 47 percent. The pressure in the pulmonary artery, however, fell to 91 percent only. Accordingly, the vessel resistance of the greater circulatory system increased only slightly, while its rise in the lesser system amounted to about 200 percent.

"Effect of Carbon Dioxide Inhalation on the Circulation of the Anesthetized Rat"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol 23, No 1, 1963, pp. 13-19.

Abstract: [English article; authors' English summary] By using the isotope fractionation method it has been shown that in rats anesthetized with sodium pentobarbital the inhalation of 3% carbon dioxide from 4 to 10 minutes had no influence on the circulation. In response to 20% carbon dioxide in 4-6 minutes so severe a peripheral vasodilatation developed that blood pressure decreased in spite of the increased cardiac output. The vasodilatation was most marked in the liver and intestines (splanchnic area) and least marked in the kidney

PERIODICAL: Khimicheskiye volokna, 1960, No. 2, pp. 57 - 60

TEXT: This is a report on the working program of the Kiyevskiy eksperimental'nyye masterskiye (Kiyev Experimental Workshops). In cooperation with the VNIIV (All-Union Scientific Research Institute of Synthetic Fibers) and the GIPROIV (State Institute for the Design and Planning of Synthetic Fiber Industry Establishments), the construction of spinning frame of the type PSh-180-I2 (Figs. 1,2) for continuous production of viscose rayon with number 60-150 is being developed. This frame is to replace the spinning frames, finishers, driers, and twisting frames hitherto used. A table compares the efficiency of the PSh-180-I2 with the machines of the type Nelson and PTe-250-I. The unit of the type ANPK-2 (Fig. 3) for continuous polymerization of caprolactam is being developed in cooperation with the Kiyevskiy kombinat iskusstvennogo volokna (Kiyev Kombinat of Synthetic Fibers). There are 3 figures and 1 table.

TITLE: On the Classification of Multiple-Signal Transmission Methods
(K voprosu o klassifikatsii sposobov mnogokratnoy peredachi signalov)

PERIODICAL: Sb. Leningrad. in-ta inzh. sh-d. transp., 1956, Nr 151, pp 152-158

ABSTRACT: Classification of methods of multiple transmission over electric-communication links is considered. A connection is indicated between the methods of multiplexing and the geometrical representation of the signal volume and the channel capacity. The importance of segregating the modulation, filtration, and synchronization operations in the analysis of characteristics of various multiple-transmission systems is noted. It is pointed out that all methods of simultaneously transmitting a great number of signals over a common link are, in fact, varieties and combinations of two basic methods -- frequency and time methods. In principle, each of the methods permits the same amount of multiplexing; however, for maximum multiplexing, certain physically realizable characteristics of the transmission system are necessary. Bibliography: 6 items.

Leningrad. Institut inzhenerov zheleznodorozhnogo transporta

Avtomatika, telemekhanika i svyaz' (Automation, Telemechanics, and Communications) Moscow, Transzheldorizdat, 1960. 230 p. (Series: Its: Sbornik, vyp. 169) 1,000 copies printed.

General Ed.: V. N. Listov, Professor; Ed.: G. I. Marenkova, Engineer; Tech. Ed.: Ye. N. Bobrova.

PURPOSE: This book is intended for technical personnel and scientists engaged in the fields of automation, telemechanics, and communications.

COVERAGE: This collection of articles presents various methods of analysis and synthesis of electric circuits. New designs are described and ways of improving technical and economic indices of communication instruments investigated. The articles contain computations for individual types of communication and telemechanical systems. No personalities are mentioned. Some of the articles are accompanied by references.

~~Card 1/11~~

Automation, Telemechanics (Cont.)

SOV/4426

The author attempts to demonstrate that a much fuller correspondence exists between the methods of network theories used in the analysis of communications systems and the concepts of linear operator theory. He indicates the possibility of a much wider utilization in the communications theory of a series of new mathematical forms for standard communications circuit components. The introduction of such mathematical forms, characteristics representing properties of idealized components of complex communications circuits (filters, modulators, and others), extends the methods of network theory and permits their use in the analysis of communications block diagrams and also narrows the gap existing between the methods of the network and information theories. The author defines linear space and subspace of signals and gives a general definition and examples of linear operators, and of their eigenfunctions and eigenvalues. Definition and properties of projection operators, functions of self-coupled operators, definition and properties of unitary operators, and the expansion of an arbitrary linear operator are also discussed. There are 6 references; 5 Soviet and 1 English.

SOV/108-15-2-5/10

(1) multiplication by a number x ; (2) differentiation D ; (3) integration D^{-1} . These operators are mathematical images or characteristics of the network elements r , L , and C . Thus three types of concepts are used: (1) the network element as, for example, an induction coil; (2) the parameter L which is the symbol of the idealized element; (3) the mathematical image, i.e., the operator D . Signals passing through a linear system undergo changes which may be determined by resolving the signal into components in accordance with proper functions of some simple operators, and by considering changes in each component. The operator characterizing the system is then represented as a function of a simple operator. Using the concept of unity resolving (N. I. Akhiezer, I. M. Glazman, *Teoriya lineynykh operatorov*, GIII, 1950) a generalized representation in form of integrals may be given to the operator, the function and the function transformal by the operator. An operator A which defines a multiplication by λ may be written as

Card 2/11

Generalized Operational Characteristics of
Filters and Modulators

77560
SOV/108-13-1-5/12

$$A = \int \lambda dE_{\lambda} \quad (3)$$

where E_{λ} is the unity development. The expression for $u(t)$ is:

$$u(t) = Eu(t) = \int dE_{\lambda} u(t) \quad (4)$$

This expression indicates that each vector is the sum of its projections. The function transformed by the operator A is then given as:

$$Au(t) = \int \lambda dE_{\lambda} u(t) \quad (5)$$

Expressions (3), (4), and (5) are skeleton equations from which expressions may be obtained defining the properties of converters or the input and output signals of communication systems. This is illustrated by two examples. The first considers an operator of the form $A = (1/\omega) \cdot d/dt$ meaning a multiplication by the factor ω . In the second example, the operator A is a multiplication by an independent variable: $A = Q = X\omega$.

Card 3/11

Generalized Operational Characteristics of
Filters and Modulators

77560
SOV/108-15-2-5/12

More complex operators may be obtained as functions of simple operators. When $\varphi(\lambda)$ is an arbitrary complex function, the operator $\varphi(A)$ is determined from Eq. (15):

$$\varphi(A)u = \int_{-\infty}^{\infty} \varphi(\lambda) dE_{\lambda} u(t). \quad (15)$$

which represents the output signal of a converter with the characteristic $\varphi(\lambda)$. The operator itself is given as:

$$\varphi(A) = \int_{-\infty}^{\infty} \varphi(\lambda) dE_{\lambda}. \quad (16)$$

For the case $A = (1/t) \cdot d/dt$ and $E_{\lambda} = E(\omega)$, the output signal is:

$$\varphi(A)u = \int_{-\infty}^{\infty} \varphi(\omega) dE_{\omega} u = \int_{-\infty}^{\infty} \varphi(\omega) U(\omega) e^{i\omega t} d\omega, \quad (17)$$

where $\varphi(\omega) = Y(\omega)$ is the frequency characteristic of the transmission function of the converter. For the case $A = Q$, $E_{\lambda} = E_{\tau}$, the output is:

$$\varphi(A)u = \int_{-\infty}^{\infty} \varphi(\tau) dE_{\tau} u = \int_0^{\infty} u(\tau) K(t-\tau) d\tau, \quad (18)$$

Card 4/11

Generalized Operational Characteristics of
Filters and Modulators

77500
SOV/100-19-05/12

where $K(t)$ is the transient characteristic of the converter. In the case of a filter, the general expression for the operational characteristic is given as:

$$\Phi_{\lambda} = \int_{\Lambda} \varphi(\lambda) dE_{\lambda}, \quad (19)$$

where $\varphi(\lambda)$ is the characteristic function of the set Λ , Λ being the "passband" of the filter. Equation (19) may be considered as a mathematical image of the concept filter. In the case of frequency filters, if A is an operator of differentiation, $E_{\lambda} = E_{\omega}$; and $\lambda = i\omega$. For the most important filter types, i.e.; low-pass filter (Fig. 1a), high-pass filter (Fig. 1b), and band-pass filter (Fig. 1c), the operators are given by Eqs. (20), (21), and (22), respectively. An expression is given also for a filter separating an arbitrary number of points on the axis ω . A contact closing or opening at certain moments is called a time filter. In this case, if A is a multiplication

Card 5/11

Generalized Operational Characteristics of
Filters and Modulators

by an independent variable operator, $E_{\lambda} = E_t$,
 $\lambda = t$. Figure 3a shows a contact which closes at
 $t = 0$ and opens at $t = \tau_1$; Fig. 3b represents a
contact closing at τ_1 and opening at τ_2 .

Fig. 3

The operators corresponding to Figs. 1a and 1b are
defined by Eqs. (29) and (30), respectively:

Card 7/11

Generalized Operational Characteristics of
Filters and Modulators

77560
SOV/103-15-2-5/12

$$\phi_{0, \tau_1} = \int_0^{\tau_1} \delta(t - \tau) d\tau = [1(t) - 1(t - \tau_1)]. \quad (29)$$

$$\phi_{\tau_1, \tau_2} = \int_{\tau_1}^{\tau_2} \delta(t - \tau) d\tau = [1(t - \tau_1) - 1(t - \tau_2)]. \quad (30)$$

An expression is also given for an operator representing a periodically closing commutator contact. For operational characteristics of modulators rotation and shift operators must be considered. These operators should not change the signal power. A generalized operator with these features is the unit operator defined as:

$$U_\tau = \int_{-\infty}^{\infty} e^{i\lambda\tau} dE_\lambda. \quad (36)$$

This expression is analogous to $A = \int \lambda dE_\lambda$ in which $\lambda = e^{i\lambda\tau}$; and E_λ is an arbitrary unity development.

Card 8/11

Generalized Operational Characteristics of
Filters and Modulators

77560
SOV/108-15-4-1/17

The function transformed by the above operator is:

$$U, u(t) = \int_{-\infty}^{\infty} e^{i\lambda t} dE, u(t). \quad (37)$$

Equations (36) and (37), as well as Eqs. (5), (6), (15), and (16), are skeleton equations. Exact expressions may be obtained by substituting E_s with specific unitary developments. The modulation is defined as a λ parameter shift which in particular cases is a shift of the frequency characteristic, or a shift of the time interval of the signal. The modulation is a reversible operation and should be represented by an operator for which must exist an inverse operator. Operator (36) satisfies these conditions. It may be considered as a generalized operational characteristic of the modulator and may be written in the form

$$M_\lambda = \int_{-\infty}^{\infty} e^{i\lambda t} dE, \quad (38)$$

Card 9/11

Generalized Operational Characteristics of
Filters and Modulators

77560
SOV/108-15-2-5/12

where λ is the shift of the signal spectrum and E_s is a development caused by an operator which is a Fourier transform of the operator causing the development E_λ . For a case of frequency modulator $E_s = E_t$, $dE_t u = u(\tau) \delta(t - \tau)$ and $\lambda = \Omega$. Then

$$\begin{aligned} U_\Omega u(t) &= M_\Omega u(t) = \int_{-\infty}^{\infty} e^{i\Omega\tau} dE_t u(t) = \\ &= \int_{-\infty}^{\infty} e^{i\Omega\tau} u(\tau) \delta(t - \tau) d\tau = u(t) e^{i\Omega t} \end{aligned} \quad (39)$$

Here, U_Ω modulates the function $u(t)$ at frequency Ω . It corresponds to a shift of the spectrum of $u(t)$ along the axis ω , the shift equalizing Ω . For a time modulator, represented by a delay line,

$E_s = E_\omega$, $dE_\omega u = U(\omega) e^{i\omega t_d} d\omega$ and $\lambda = \tau$.

Card 10/11

Generalized Operational Characterization of
Filters and Modulators

17:00
SOV/103-15-1-1/1

Then

$$U_{\tau} u(t) = M_{\tau} u(t) = \int_{-\infty}^{\infty} e^{i\omega\tau} dE_{\omega} u(t) \\ = \int_{-\infty}^{\infty} e^{i\omega\tau} U(\omega) e^{i\omega t} d\omega = u(t + \tau). \quad (40)$$

Here the unit operator U_{τ} causes the vector $U(\omega) e^{i\omega t}$ to rotate at an angle $\omega\tau$. It corresponds to a shift τ of $u(t)$ along the axis t . The author concludes that operational characteristics may contribute to a more correct evaluation of functions performed by various blocks of a communication system. KALLIANPUR, G.

✓ Kallianpur, G. On a limit theorem for dependent random variables. Dokl. Akad. Nauk SSSR (N.S.) 101, 13-16 (1955). (Russian)

Let X_1, X_2, \dots be a sequence of m -dependent random variables, that is, (X_1, \dots, X_i) and (X_j, \dots, X_n) are independent if $i - r > m$. Suppose that $EX_i = 0$, $\sup_i E\{X_i^2\} < \infty$, and that $\lim_{n \rightarrow \infty} n^{-1} \sum_{i=1}^n A_{i,n} = A \neq 0$ uniformly as i varies, where $A_i = E\{X_i^2\} + 2 \sum_{j=1}^m E\{X_{i+m-j} X_{i+m}\}$. Then it is proved that $\sum_{i=1}^n X_i / n^{1/2}$ is asymptotically normal, with mean 0 and variance A if, for every $\epsilon > 0$,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n \int_{|x| > n^{\epsilon/2}} x^2 dF_i(x) = 0,$$

where F_i is the distribution function of X_i . This result generalizes theorems of Hoeffding and Robbins [Duke Math. J. 15, 773-780 (1948); MR 10, 200] and of Dianzani [Proc. Cambridge Philos. Soc. 49, 239-246 (1953); 50, 287-292 (1954); MR 14, 771; 15, 635] on m -dependent random variables.

Deformation under load at high temperatures of alumina-
 silicate refractories with high content of aluminum. N. S.
 Ponomarev and G. P. Kalliga (Mendeleev Chem. Tech.
 Inst., Moscow). *Ogneupory* 16, 272-80 (1951); *cf.*
C.A. 44, 7503i. Plastic molded shapes having 39, 55,
 70, 80, 90, and > 99% Al_2O_3 and contg., resp., 4.7, 3.8,
 3.0, 2.5, 2.0, and 0.5% fluxes were fired, resp., at 1420,
 1520, 1650, 1700, 1700, and 1750°. Detns. were made of
 the temps. of initial softening and of deformations corre-
 sponding to 4, 10, 20, and 40% compression under a load of 2
 kg./sq. cm. With increasing Al_2O_3 , there was a rise in temp.
 of deformation related to changes in phase compn. during
 firing at temps. at which the processes of crystn. were com-
 pleted. An increase in the solid phase in the body and a
 corresponding decrease in the amorphous substance governs
 the rise in temp. of deformation. This regularity in rise of
 temp. of deformation was noted fully in shapes only up to
 the compn. of mullite. A pure mullite body had the highest
 softening temp.; for 3% fluxes, initial softening was at 1690-
 1620° and 40% compression at 1800-1820°. Further in-
 crease of Al_2O_3 in refractories of the mullite-corundum type
 (70-90% Al_2O_3) did not cause a noticeable rise in the
 temp. of deformation. This may be explained by the fact
 that deformation of such refractories is due to the softening
 of the mullite portion of the body. The corundum phase
 of the body, disconnected by the mullite and the correspond-
 ing amt. of amorphous substance, cannot raise the softening
 temp. of the material as a whole. Max. approximation and
 changeover to a pure corundum, completely cryst. body was
 accompanied by a sharp rise in initial softening temps. up
 to 1900° and higher. B. Z. Kamich

Title: Increasing the Thermal Stability of Acid-Resistant Ceramic Pastes

Original

Periodical: Steklo i keramika, 1956, No 3, 16-19

Abstract: Investigation of the effect of a number of factors on thermal stability (T) of pastes, approximating in composition acid-resistant and acid-heat resistant. It was found that an increase of the chamotte content of the paste (from 20 to 60%) results in an increased porosity (from 2.1 to 12.3%) and decreased elasticity modulus (from 9 to 6.2 thousand kg/cm²), and notwithstanding a certain lowering of compression strength (from 840 to 660 kg/cm²), enhances the T of the paste (from 53 to 82 heating periods). Larger size of granular components either by the use of larger grains of

USSR/Chemical Technology - Chemical Products and Their Application. Silicates.
Glass. Ceramics. Binders, I-9

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 62338

Abstract: chamotte (from 0.5 to 2 mm) or by decreasing the content of pulverulent fractions (<0.12 mm) greatly enhances T of the material (from 60 to 116 heating periods). Higher T was also observed on inclusion of kaolin (up to 20%) and talc additions (up to 24%). It is shown that with increased porosity and lowering of elasticity modulus T of the samples increases. The elasticity modulus can serve to a certain extent as a criterion in evaluation of T.

TITLE: On the Problem of the Technology of Zirconium Products by Means of the Method of Casting From Aqueous Suspensions (K voprosu tekhnologii tsirkoniyevykh izdeliy metodom lit'ya iz vodnykh suspenziy)

PERIODICAL: Nauchnyye doklady vysshey shkoly. Khimiya i khimicheskaya tekhnologiya, 1959, Nr 2, pp 386-389 (USSR)

ABSTRACT: This work was carried out in co-operation with the Podoliya Works for Refractories (Podol'skiy zavod ognepornykh izdeliy) and the Leningrad Institute for Physical Chemistry of Silicates of the AS USSR (Leningradskiy institut fizicheskoy khimii silikatov AN SSSR). The institute mentioned under Association systematically investigated the technology named in the title. Technical zirconium-oxide (analysis in Table 1) was used and MgO , $Ca(OH)_2$ or $CaCO_3$ served as stabilizers. The raw material was wet-ground in a ball-mill, the ZrO_2 freed from iron through hydrochloric acid. The distribution of the grain-sizes in the ground zirconium-oxide is shown in table 2. The optimal composition of the raw-material under variation of the humidity content

(52-60%) and the pH-value (8.0 - 9.7) of the surroundings was determined through casting tests. Specific gravity, water absorption, porosity, and shrinkage were determined after the burning (at 1720 - 1738 degrees). The results are listed in table 3. The specific gravity was 5.26-5.29 g/cm³, the water absorption 0.2 - 0.6%. The optimal humidity content was 60% at a stabilization through MgO, 42% with CaCO₃ as stabilizer. The shrinkage was approximately 25% when CaCO₃ was used, and was by 7% lower than with MgO. The bigger stability, smaller humidity of the raw-material and smaller shrinkage by adding CaCO₃ indicate its being the most suitable stabilizer in comparison with MgO. There are 1 figure, 4 tables, and 8 references, 3 of which are Soviet.

TITLE: Improvement of the technology of zirconium products for
casting from aqueous suspensions of the pre-stabilized ZrO_2

PERIODICAL: Ogneupory, no. 7, 1961, 301-302

TEXT: Experiments are described here which were conducted at the Podol'skiy zavod ogneupornykh izdeliy (Podol'sk Plant of Refractory Products) to investigate the possibility of avoiding the previous grinding of zirconium dioxide and, thus, shorten the technology of zirconium products. Industrial zirconium dioxide with a content of 97.5% $ZrO_2 + HfO_2$ and chemically pure calcium carbonate were used for the experiment. A mixture of 93% ZrO_2 and 7% CaO was prepared. Briquets were pressed from it at a pressure of 500 kg/cm² and burned at temperatures of 1600°C and 1700°C respectively. The microscopic and X-ray structural analysis showed a stabilization degree of 93-95% of ZrO_2 in the briquets. The effect of the pH of the

medium on the viscosity index of the crude zirconium mass was also tested. The particles are characterized by high values of the ζ potential, which cause the stability of the crude mass. With the parameters mentioned, an experimental batch of crucibles with a content up to 300 cm³ was cast. The characteristic values of the blanks and of the products burned for 9 hr at 1600°C are compared in the table with the characteristic values for previous grinding of ZrO₂ and rinsing before stabilization. The duration of the production cycle is shortened by about ten days and grinding and rinsing of ZrO₂ previous to preparation for stabilization are omitted. The use of stabilized ZrO₂ without previous grinding showed that the sintering ability of the material was slightly improved. There are 1 figure and 1 table.

TITLE: Peculiarities of the casting technology for zirconium products

PERIODICAL: Ogneupory, no. 1, 1962, 28-34

TEXT: An investigation conducted jointly with the Podol'skiy zavod ogneupornykh izdeliy (Podol'sk Plant of Refractory Products) dealt with the following processes: (1) Dressing of the raw material, (2) its acid treatment and the casting process in various media. Experiments were conducted with zirconium dioxide (97.55% ZrO_2 , 1.15% TiO_2) which was stabilized by admixture of 6% CaO . Industrial ZrO_2 and $CaCO_3$ were used as initial materials. Zirconium dioxide was ground, washed with HCl , and brought to $pH = 3$ with water. $CaCO_3$ was ground in a corundum mill. Briquettes were molded from these materials at 500 kg/cm^2 , and fired at 1750°C . Two types of initial dross were used: alkaline with $pH = 10.5$ and acid with $pH = 1.5-1.7$. The casting properties of alkaline and acid dross were determined. L. G. Markaryan, V. I. Markaryan, L. M. Privina,

Peculiarities of the casting ...

and M. I. Minkina assisted with this study. Alkaline dross has poor casting properties. When using acid dross, washing with HCl may improve casting properties, increase the density of the blanks, and reduce shrinkage during firing. A moisture of about 30% and pH = 1.5-2.0 were found to be most suitable for the casting of dross from stabilized ZrO_2 washed with HCl, the density of the casting being 2.8 g/cm^3 and that of the fired product 5.45 g/cm^3 . 2-4 days' storage after washing increases the density of the blanks by up to 0.2 g/cm^3 . There are 5 figures, 4 tables, and 11 references: 7 Soviet and 4 non-Soviet. The four references to English-language publications read as follows: C. E. Curtis, Journ. Am. Cer. Soc., 1947, 30, no. 6; St. Pierre, Trans. Brit. Cer. Soc., 1952, 51, 260; M. A. Schwartz, G. D. White, C. E. Curtis, Atomic Energy Comp. Inform. Service Oak Ridge. 1953, 1354, 28; B. C. Weber, P. E. TITLE: On the problem of stabilizing and sintering high-purity zirconium dioxide

PERIODICAL: Ogneupory, no. 4, 1963, 175 - 179

TEXT: The material investigated was zirconium oxide containing 99.5% basic oxide, 0.1% HfO_2 and 0.4% other admixtures. MgO and CaO were used for stabilization; to reveal the effect of the type of anion, CaF_2 was employed. Twelve types of experimental substances were prepared with a gradually increasing content (from 4 to 15 mol%) of the stabilizing agent. Specimens were prepared by semi-dry pressing under 450 kg/cm^2 pressure. The moisture of the pressed powders was 6%. The dried specimens were annealed at $1,710^\circ\text{C}$ with 5 h holding and slowly cooled down. The following results are obtained. Under conditions of oxidizing annealing at $1,710^\circ\text{C}$ during 5 h, substances with 10 mol% of stabilizing oxide are fully sintered. Stabilization is sufficient and the material acquires high strength and heat resistance as compared with other investigated substances. If

the amount of the stabilizing agent is increased to 12 - 15% a well-sintered and fully stabilized product is obtained; however, the density of the material is reduced which appears particularly when CaO is added. Moreover, the strength and heat-resistance are sharply reduced. The relatively low density of an annealed substance with 10 mol% of a stabilizing admixture (for CaO 5.20 and for MgO 5.28 g/cm³), is mainly determined by the presence of pores, both inside and on the boundaries of the material crystals. A rise of the annealing temperature to 2,200°C has only a slight effect on the material density. A higher density of a material with 10 mol% CaO is attained a) by changing the type of anion introduced together with the stabilizer CO₃ to F⁻; the heat-resistance of the material is then strongly impaired; b) by preliminary sintering of the stabilized product; as a result specimens of 5.54 g/cm³ volumetric weight are obtained. There are 3 tables and 5 figures.

PHASE I BOOK EXPLOITATION

SOV/6202

Budnikov, P. P., Academician, Academy of Sciences UkrSSR, Corresponding Member, Academy of Sciences USSR, A. S. Berezhnuy, I. A. Bulavin, G. P. Kalliga, G. V. Kukolev, and D. N. Poluboyarinov.

Tekhnologiya keramiki i ogneporov (Technology of Ceramics and Refractory Materials), 3d ed., rev. and enl. Moscow, Gosstroyizdat, 1962. 707 p. Errata slip inserted. 15,000 copies printed.

Ed. (Title page): P. P. Budnikov; Ed. of Publishing House: N. A. Gomozova; Tech. Ed.: G. D. Naumova.

PURPOSE: This book is a textbook intended for students taking courses in the technology of silicates at institutions of higher education.

COVERAGE: The book describes the physicochemical and mechanical properties of various ceramic and refractory products, including cermets, pure refractory oxides, glazes, ceramic pigments, porcelain, and faience. The raw materials and methods of manufacturing ceramic

and refractory products are reviewed. There are 167 references, mostly Soviet.

TABLE OF CONTENTS [Abridged]:

Foreword	3
Short history	5

PART I. STRUCTURAL CERAMICS

Ch. 1. Classification of the Products	13
Ch. 2. Materials for Walls, Roofing, and Building Facades	15
Ch. 3. "Keramzit" [Porous Clay Filler]	79
Ch. 4. Tile for Room Stoves (Dutch Tile) and Majolica Ware	82
Ch. 5. Ceramic Stoveware	89
